Paper 3 Further Mechanics

October/November 2023

1 hour 30 minutes

You must answer on the question paper.

You will need: List of formulae (MF19)

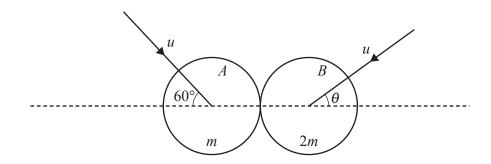

#### **INSTRUCTIONS**

- Answer all questions.
- Use a black or dark blue pen. You may use an HB pencil for any diagrams or graphs.
- Write your name, centre number and candidate number in the boxes at the top of the page.
- Write your answer to each question in the space provided.
- Do **not** use an erasable pen or correction fluid.
- Do not write on any bar codes.
- If additional space is needed, you should use the lined page at the end of this booklet; the question number or numbers must be clearly shown.
- You should use a calculator where appropriate.
- You must show all necessary working clearly; no marks will be given for unsupported answers from a calculator.
- Give non-exact numerical answers correct to 3 significant figures, or 1 decimal place for angles in degrees, unless a different level of accuracy is specified in the question.
- Where a numerical value for the acceleration due to gravity (g) is needed, use  $10 \,\mathrm{m\,s^{-2}}$ .

#### **INFORMATION**

- The total mark for this paper is 50.
- The number of marks for each question or part question is shown in brackets [ ].

This document has 16 pages. Any blank pages are indicated.

Two uniform smooth spheres A and B of equal radii have masses m and 2m respectively. The two spheres are moving with equal speeds u on a smooth horizontal surface when they collide. Immediately before the collision, A's direction of motion makes an angle of  $60^{\circ}$  with the line of centres, and B's direction of motion makes an angle  $\theta$  with the line of centres (see diagram). The coefficient of restitution between the spheres is e.

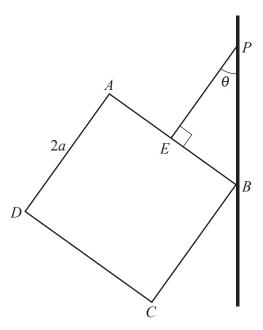

After the collision, the component of the velocity of A along the line of centres is v and B moves perpendicular to the line of centres. Sphere A now has twice as much kinetic energy as sphere B.

(a)	Show that $v = \frac{1}{2}u(4\cos\theta - 1)$ .	1]

Deduce what happens to v for large values of t.	

A uniform square lamina of side 2a and weight W is suspended from a light inextensible string attached to the midpoint E of the side AB. The other end of the string is attached to a fixed point P on a rough vertical wall. The vertex B of the lamina is in contact with the wall. The string EP is perpendicular to the side AB and makes an angle  $\theta$  with the wall (see diagram). The string and the lamina are in a vertical plane perpendicular to the wall. The coefficient of friction between the wall and the lamina is  $\frac{1}{2}$ .

Given that the vertex $B$ is about to slip up the wall, find the value of $\tan \theta$ .	[8]

A light elastic string has natural length 8a and modulus of elasticity 5mg. A particle P of mass m is attached to the midpoint of the string. The ends of the string are attached to points A and B which are a distance 12a apart on a smooth horizontal table. The particle P is held on the table so that AP = BP = L (see diagram). The particle P is released from rest. When P is at the midpoint of AB it has speed  $\sqrt{80ag}$ .

Find $L$ in terms of $a$ .	[5]

A particle P of mass m is attached to one end of a light inextensible rod of length 3a. An identical particle Q is attached to the other end of the rod. The rod is smoothly pivoted at a point O on the rod, where OQ = x. The system, of rod and particles, rotates about O in a vertical plane.

At an instant when the rod is vertical, with P above Q, the particle P is moving horizontally with speed u. When the rod has turned through an angle of  $60^{\circ}$  from the vertical, the speed of P is  $2\sqrt{ag}$ , and the tensions in the two parts of the rod, OP and OQ, have equal magnitudes.

(a)	Show that the speed of $Q$ when the rod has turned through an angle of $60^{\circ}$ from the vertical is
	$\frac{2x}{3a-x}\sqrt{ag}.$ [2]
(b)	Find $x$ in terms of $a$ . [5]

(c)	Find $u$ in terms of $a$ and $g$ .	[4]
