CANDIDATE NAME							
CENTRE NUMBER				CANDIDAT NUMBER	E		
FURTHER MAT	HEMATICS	3					9231/23
Paper 2					Octobe	er/Nove	mber 2019
							3 hours
Candidates ans	wer on the	Question P	aper.				
Additional Mater	ials: Li	st of Formu	ulae (MF10))			

READ THESE INSTRUCTIONS FIRST

Write your centre number, candidate number and name in the spaces at the top of this page.

Write in dark blue or black pen.

You may use an HB pencil for any diagrams or graphs.

Do not use staples, paper clips, glue or correction fluid.

DO NOT WRITE IN ANY BARCODES.

Answer all the questions in the space provided. If additional space is required, you should use the lined page at the end of this booklet. The question number(s) must be clearly shown.

Give non-exact numerical answers correct to 3 significant figures, or 1 decimal place in the case of angles in degrees, unless a different level of accuracy is specified in the question.

Where a numerical value is necessary, take the acceleration due to gravity to be 10 m s⁻².

The use of a calculator is expected, where appropriate.

Results obtained solely from a graphic calculator, without supporting working or reasoning, will not receive credit.

You are reminded of the need for clear presentation in your answers.

At the end of the examination, fasten all your work securely together.

The number of marks is given in brackets [] at the end of each question or part question.

This document consists of 23 printed pages and 1 blank page.

2

A uniform square lamina ABCD of side 4a and weight W rests in a vertical plane with the edge AB inclined at an angle θ to the horizontal, where $\tan \theta = \frac{1}{3}$. The vertex B is in contact with a rough horizontal surface for which the coefficient of friction is μ . The lamina is supported by a smooth peg at the point E on AB, where BE = 3a (see diagram).

(i)	Find expressions in terms of W for the normal reaction forces at E and B .	[5]

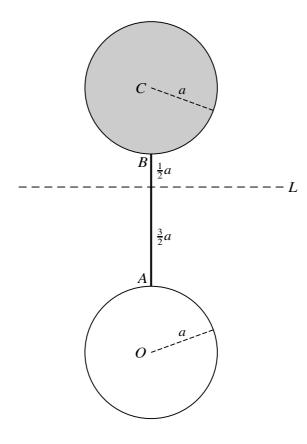

(ii)	Given that the lamina is about to slip, find the value of μ . [3]

***	ith speed u .
i)	Show that the speed of A after its collision with B is $\frac{1}{2}u(1-e)$ and find the speed of B.
	ere B now collides with sphere C . Subsequently there are no further collisions between any of the eres.
he	
he	eres.

of the P is	article P of mass m is attached to one end of a light inextensible string of length a . The other end e string is attached to a fixed point O and P is held with the string taut and horizontal. The particle projected vertically downwards with speed $\sqrt{(2ag)}$ so that it begins to move along a circular path. string becomes slack when OP makes an angle θ with the upward vertical through O .
(i)	Show that $\cos \theta = \frac{2}{3}$. [5]

(ii)	Find the greatest height, above the horizontal through O , reached by P in its subsequent motion. [4]

5

A thin uniform rod AB has mass λM and length 2a. The end A of the rod is rigidly attached to the surface of a uniform hollow sphere (spherical shell) with centre O, mass 3M and radius a. The end B of the rod is rigidly attached to the surface of a uniform solid sphere with centre C, mass 5M and radius a. The rod lies along the line joining the centres of the spheres, so that CBAO is a straight line. The horizontal axis L is perpendicular to the rod and passes through the point of the rod that is a distance $\frac{1}{2}a$ from B (see diagram). The object consisting of the rod and the two spheres can rotate freely about L.

(i)	Show that the moment of inertia of the object about L is $\left(\frac{408 + 7\lambda}{12}\right)Ma^2$.	,]
		••
		••
		••

	period of small oscillations of the object about L is $5\pi\sqrt{\left(\frac{2a}{g}\right)}$.
(ii)	Find the value of λ . [6]

	ributed. A 95% confidence interval for the population mean height, μ metres, is calculate as $1.65 \le \mu \le 1.85$.

9 A random sample of five pairs of values of x and y is taken from a bivariate distribution. The values are shown in the following table, where p and q are constants.

x	1	2	3	4	5
y	4	p	q	2	1

The equation of the regression line of y on x is y = -0.5x + 3.5.

(i)	Find the values of p and q .	[7]

11 Answer only **one** of the following two alternatives.

EITHER

The points A and B are a distance 1.2 m apart on a smooth horizontal surface. A particle P of mass $\frac{2}{3}$ kg is attached to one end of a light spring of natural length 0.6 m and modulus of elasticity 10 N. The other end of the spring is attached to the point A. A second light spring, of natural length 0.4 m and modulus of elasticity 20 N, has one end attached to P and the other end attached to B.
