FURTHER MATHEM	ATICS		9231/23
Paper 2			May/June 2019
			3 hours
Candidates answer of	on the Question Paper.		
Additional Materials:	List of Formulae (MF10)		

READ THESE INSTRUCTIONS FIRST

Write your centre number, candidate number and name in the spaces at the top of this page.

Write in dark blue or black pen.

You may use an HB pencil for any diagrams or graphs.

Do not use staples, paper clips, glue or correction fluid.

DO NOT WRITE IN ANY BARCODES.

Answer **all** the questions in the space provided. If additional space is required, you should use the lined page at the end of this booklet. The question number(s) must be clearly shown.

Give non-exact numerical answers correct to 3 significant figures, or 1 decimal place in the case of angles in degrees, unless a different level of accuracy is specified in the question.

Where a numerical value is necessary, take the acceleration due to gravity to be 10 m s^{-2} .

The use of a calculator is expected, where appropriate.

Results obtained solely from a graphic calculator, without supporting working or reasoning, will not receive credit.

You are reminded of the need for clear presentation in your answers.

At the end of the examination, fasten all your work securely together.

The number of marks is given in brackets [] at the end of each question or part question.

(i`) Show that $\cos \alpha = \frac{3}{4}$.	ag when P is at A .
(1)) Show that $\cos \alpha = \frac{1}{4}$.	

(ii)	Find the tension in the string when P is at B . [2]

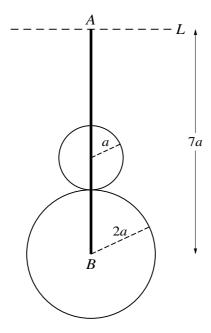

3

Three uniform small spheres A, B and C have equal radii and masses 3m, m and m respectively. The

)	Find, in terms of u and e , expressions for the speeds of A , B and C after the first two collisions [6]

(ii)	Given that A and C are moving with equal speeds after these two collisions, find the value of e . [3]

4

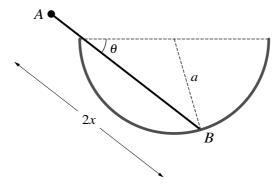

An object consists of two hollow spheres which touch each other, together with a thin uniform $\operatorname{rod} AB$. The rod passes through small holes in the surfaces of the spheres. The rod is fixed to the spheres so that it passes through the centre of the smaller sphere. The end B of the rod is at the centre of the larger sphere. The larger sphere has radius 2a and $\operatorname{mass} M$, the smaller sphere has radius a and $\operatorname{mass} kM$, and the rod has length a and a and a and a is perpendicular to a (see diagram).

)	Find the moment of inertia of the object, consisting of the rod and two spheres, about L . [6]

The object is pivoted at A so that it can rotate freely about L. The object is released from rest with the rod making an angle of 60° to the downward vertical. The greatest angular speed attained by the object in the subsequent motion is $\frac{9}{20}\sqrt{\left(\frac{g}{a}\right)}$.

Find the value of k .	[5

A uniform rod AB of length 2x and weight W rests on the smooth rim of a fixed hemispherical bowl of radius a. The end B of the rod is in contact with the rough inner surface of the bowl. The coefficient of friction between the rod and the bowl at B is $\frac{1}{3}$. A particle of weight $\frac{1}{4}W$ is attached to the end A of the rod. The end B is about to slip upwards when AB is inclined at an angle θ to the horizontal, where $\tan \theta = \frac{3}{4}$ (see diagram).

(i)	By resolving parallel to the rod, show that the normal component of the reaction of the bowl on the rod at B is $\frac{3}{4}W$.

8 Two salesmen, *A* and *B*, work at a company that arranges different types of holidays: self-catering, hotel and cruise. The table shows, for a random sample of 150 holidays, the number of each type arranged by each salesman.

			Type of holiday	
		Self-catering	Hotel	Cruise
Salesman	A	25	38	21
Salesillali	В	28	21	17

Test at the 10% significance level whether the type of holiday arranged is independent of the salesman. [8]

9	A farmer grows large amounts of a certain crop. On average, the yield per plant has been 0.75 kg.
	The farmer has improved the soil in which the crop grows, and she claims that the yield per plant has
	increased. A random sample of 10 plants grown in the improved soil is chosen. The yields, $x \log x$
	summarised as follows.

 $\Sigma x = 7.85 \qquad \Sigma x^2 = 6.19$

11 Answer only **one** of the following two alternatives.

EITHER

A light spring has natural length a and modulus of elasticity kmg. The spring lies on a smooth horizontal surface with one end attached to a fixed point O. A particle P of mass m is attached to the other end of the spring. The system is in equilibrium with OP = a. The particle is projected towards O with speed u and comes to instantaneous rest when $OP = \frac{3}{4}a$.

(i)	Use an energy method to show that $k = 1$	$=\frac{16u^2}{ag}.$		[2]
(ii)	Show that P performs simple harmon answer in terms of u and a .	ic motion and fi	nd the period of thi	s motion, giving your [4]

energy.

OR

A company produces packets of sweets. Two different machines, A and B, are used to fill the packets. The manager decides to assess the performance of the two machines. He selects a random sample of 50 packets filled by machine A and a random sample of 60 packets filled by machine B. The masses of sweets, $x \log A$, in packets filled by machine A and the masses of sweets, B are summarised as follows.

$$\Sigma x = 22.4$$
 $\Sigma x^2 = 10.1$ $\Sigma y = 28.8$ $\Sigma y^2 = 16.3$

A test at the $\alpha\%$ significance level provides evidence that the mean mass of sweets in packets filled by machine A is less than the mean mass of sweets in packets filled by machine B . Find the set of possible values of α . [12]

Additional Page

If you use the following lined page to complete the answer(s) to any question(s), the question number(s) must be clearly shown.
